Executive Summary

The Florida Department of Health (Department) presents this report to the Governor, the President of the Senate, and the Speaker of the House of Representatives, as required by section 383.21625, Florida Statutes. Fetal and Infant Mortality Review (FIMR) is a community level, evidence-based process that reviews fetal and infant deaths, formulates programs, and influences policy that will lead to improving pregnancy and birth outcomes. The goal is to assess, monitor, and improve service systems and resources for women, infants, and families. Each FIMR committee must:

- Review and analyze rates, trends, causes, and other data related to fetal and infant mortality and morbidity in a geographic area.
- Develop findings and recommendations for interventions and policy changes to reduce fetal and infant mortality and morbidity rates.
- Engage with local communities and stakeholders to implement recommended policies and procedures to reduce fetal and infant mortality and morbidity.
- Report the findings and recommendations developed by each FIMR committee to the Department annually.

The report includes findings and recommendations developed by each FIMR committee from fetal and infant deaths that occurred in calendar year 2024, reviewed by FIMR committees during Fiscal Year 2024-25. The report includes:

- Background of the FIMR program and related Florida Statutes
- Explanation of statewide implementation of FIMR committees
- Summary of the FIMR process, including its relevance to improving fetal and infant outcomes
- Identified factors experienced by families that may increase their risk of poor outcomes
- Summary of statewide and regional data

Background

The Florida Department of Health, Division of Community Health Promotion, Bureau of Family Health Services, Maternal and Child Health Section (MCH) is responsible for coordination and oversight of the FIMR process. The MCH Section contracts with 32 nonprofit Healthy Start Coalitions, and partners with the Department of Health in Desoto County to implement the FIMR process at the local level.

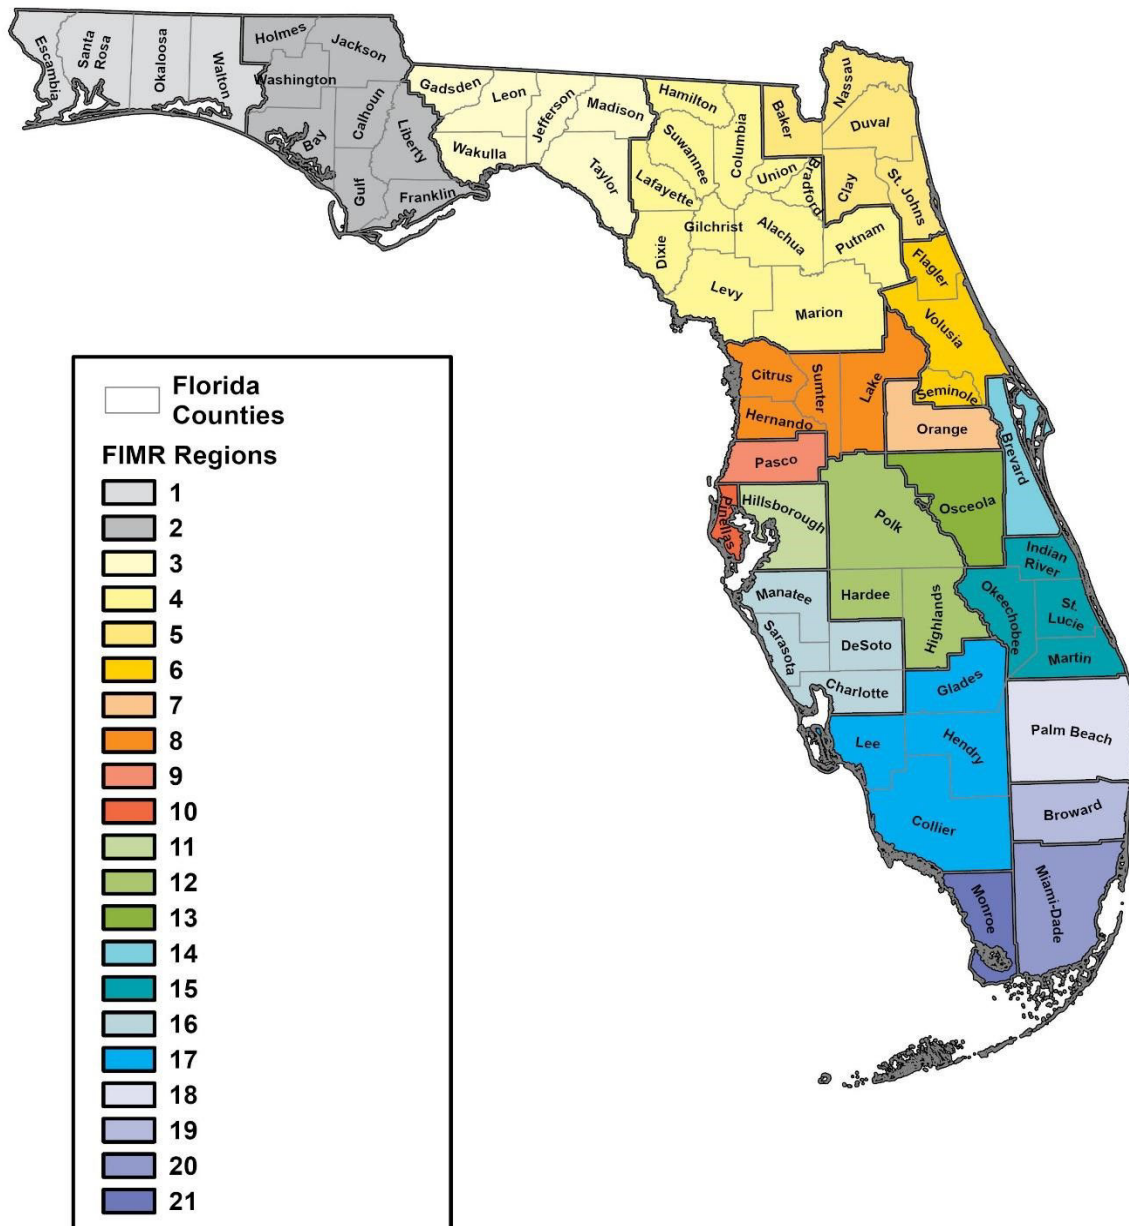

Implementation

FIMR is divided into 21 regions as indicated in Figure 1. Regional implementation allows FIMR committees to identify local opportunities for improvement and to leverage local resources. Multiple factors were considered when determining the regions. These include urban or rural areas, total number of coalitions, available funding, public access to perinatal health care, and average number of fetal and infant deaths that have occurred within the region.

Each FIMR committee will review a varying number of cases each year based on the number of fetal and infant deaths over the previous five-year span.

FIMR Structure

Figure 1. Map of FIMR Regions, by County, Florida

FIMR Framework

The Department adopted the national FIMR framework, illustrated in Figure 2, as the guide for implementation in Florida. The framework includes an ongoing cycle of improvement that is designed for health care providers, systems, and the community.

Figure 2. FIMR Framework

National Center for Fatality Review and Prevention (2021, December 1). *Fetal and Infant Mortality Review Manual A Guide for Communities*. <https://ncfrp.org/>. Retrieved March 31, 2023, from <https://ncfrp.org/wp-content/uploads/NCRPCD-Docs/FIMRManual.pdf>

Case Review & Data Gathering

The multidisciplinary Case Review Team reviews cases to identify barriers to care and trends in service delivery, and bring ideas to improve policies and services that affect families.

The FIMR process is built on the foundation of identifying and gathering information on occurrences of fetal and infant loss, referred to as “cases.” Fetal and infant case information is obtained from the Department’s Bureau of Vital Statistics.

To assist FIMR committees with accurate and efficient case identification, the Department streamlined an automated process. Prior to statewide FIMR implementation, coalitions with FIMR committees were obtaining fetal and infant death certificates by routinely traveling to their county health departments to pick up printed copies, which were then delivered to trained medical abstractors to begin case development. MCH collaborated with the Bureau of Vital Statistics to identify a method of secure, electronic record identification and delivery to each of the 21 FIMR regions. The current process provides the most recent fetal and infant death certificates and the linked birth certificates monthly.

The Department developed the following guidelines for case selection:

- Cases should first be grouped by the underlying cause of death. The underlying cause of death is the event that initiated the chain of events that led to the loss.
- Cases selected should be assorted based on identified variables such as age at death, birthweight, and location (county and ZIP code).
- After cases are selected, they are assigned to a medical abstractor who is responsible for identifying the pertinent medical and social histories to tell the story of the family and their experiences leading to the loss.

The Department has continued its partnership with the National Center for Fatality Review and Prevention (National Center), a program housed at the Michigan Public Health Institute. The National Center serves not only as the technical support and data center for the FIMR program, but also for Child Death Review programs throughout the U.S. The National Center hosts online learning modules, publishes guidance reports, and facilitates multiple monthly and quarterly online calls for FIMR committees and Child Death Review programs for collaboration and support.

The expanded data use agreement with the National Center now permits all FIMR committees under section 383.21625(3), F.S., to input their collected data into the National Fatality Review Case Reporting System. This system, hosted by the National Center, offers data storage and enables further analysis at both regional and state levels.

A multidisciplinary team, called the case review team (CRT), is convened to review the deidentified case details for the purpose of identifying gaps in services, protective and contributing factors. CRT members are then challenged to develop recommendations for

enhancements of services at the individual, provider, and community levels to improve fetal and infant outcomes.

As cases are reviewed, the CRT identifies factors that are considered either protective or possibly contributing to poor outcomes. Protective factors include services received by the mother or the family that promote healthy pregnancies and birth outcomes. Examples of protective factors include prenatal care, home visiting services, and health insurance.

Contributing factors are elements that increase the risk of a poor outcome. Examples of contributing factors include maternal pre-existing conditions, pre-term labor, or other fetal or infant medical conditions. The identification of protective and contributing factors guides the development of recommendations to improve gaps in services.

The CRT reviews cases from all counties within the region and includes representation from all coalitions within the region. It also includes representation of medical and agency professionals who provide health care services and resources to families within the community. Examples of membership include:

- Pediatricians
- Obstetricians
- Maternal fetal medicine specialists
- Neonatologists
- Family practice physicians
- Social workers with MCH experience
- County health departments
- Perinatal data experts
- Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) staff
- Medical examiner
- Hospital administrators
- Social service agencies
- Others with MCH background and experience

Community Action

The Community Action Group receives recommendations from the CRT and is charged with developing and implementing plans leading to positive change within the community.

Each of the 21 regions has one CRT, coordinated by a lead coalition. The lead coalition was determined by the Department based on previous experience operating the FIMR process and/or having a greater number of fetal and infant deaths over the last five years. This lead coalition is responsible for overseeing the tasks leading up to and including case review meetings. This includes the process of case selection, case development, data entry, recruitment of medical abstractors and CRT members, and coordinating meeting events. Figure 3 identifies the coalitions that are responsible for CRTs.

The next step in the FIMR cycle is implementation of a community action group. This group plans and implements local action steps (based on the CRT recommendations) to improve fetal and infant outcomes. Each coalition is responsible for recruiting and coordinating members for a community action group.

The community action group includes individuals with the ability and/or resources to drive large-scale system change and impact on community change. Examples of membership on community action groups include:

- Healthy Start Coalitions
- Obstetric, gynecologic, and pediatric health care providers
- Hospital administrators
- County health departments
- Social service agencies
- Members of city councils
- Chambers of commerce
- Local March of Dimes chapters

Community Advocates

The 21 FIMR regions include 33 community action groups. Each community action group is responsible for reviewing the recommendations received from the regional CRT quarterly. During the year, these groups identify ways to implement recommendations into existing programs or develop new initiatives.

Each community action group identifies local and regional partnering organizations, agencies, and individuals who assist in advancing recommendations toward implementation. The purpose of these collaborative efforts is to achieve goals for local system improvements.

Changes in Community Systems

Changes implemented at the community level result in improved outcomes for families.

The final phase of the FIMR process is the enactment of solutions. FIMR committees demonstrate process changes at the community level that include improvements in policies, procedures, availability of services, and reduction of barriers to access services.

Through the FIMR process, the community is empowered to positively improve fetal and infant health outcomes. Examples include increased home visiting services, expansion of doula services, and increased partnerships with community and faith-based organizations.

Fetal and Infant Mortality Data

Fetal Data

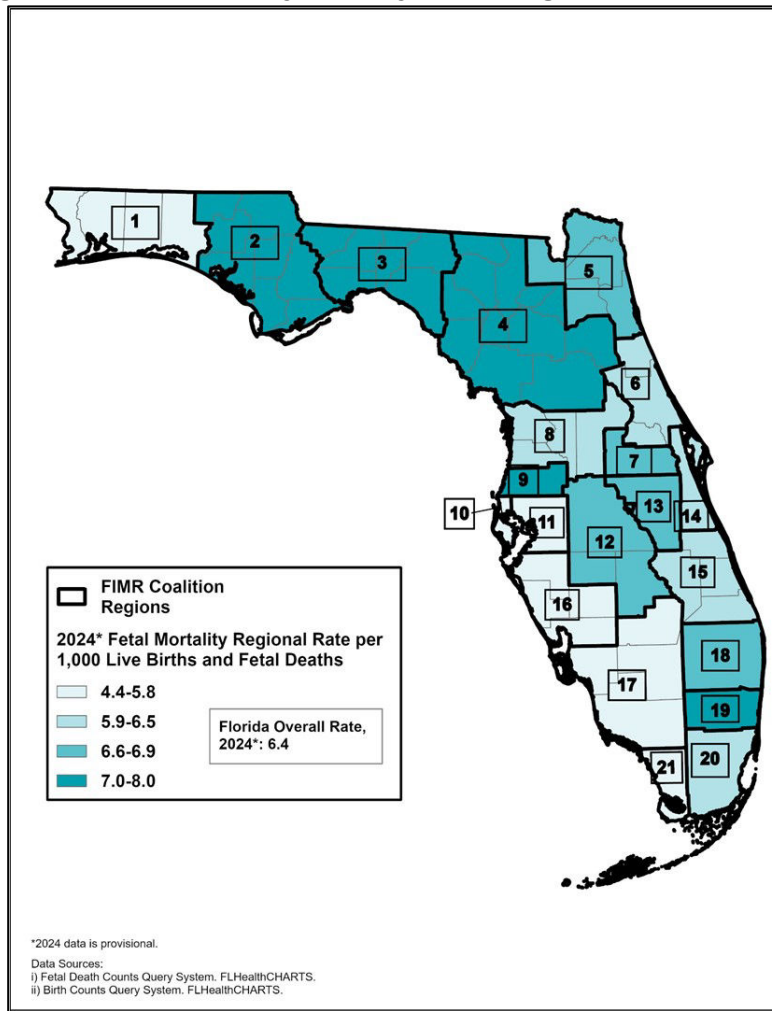

Fetal mortality, or stillbirth, is the death of a fetus at 20 weeks or more of gestation. The fetal mortality rate is calculated by the number of resident fetal deaths in a specific geographic area divided by the number of resident live births plus fetal deaths in the same geographic area, within a specified period, multiplied by 1,000.

Figure 3. Top Five Leading Causes of Fetal Death (n=1,463), Florida, 2024*

Cause of Death	Count	Percent
Complications of Placenta, Cord, and Membranes	415	28.4%
Unspecified Cause	293	20.0%
Maternal Complications of Pregnancy	254	17.4%
Maternal Conditions That May Be Unrelated to Present Pregnancy	177	12.1%
Congenital Malformations, Deformations, and Chromosomal Abnormalities	115	7.9%

Data Source: FLHealthCHARTS *Includes 2024 provisional data.

Figure 4. Fetal Mortality Rate by FIMR Regions, Florida, 2024*

Infant Data

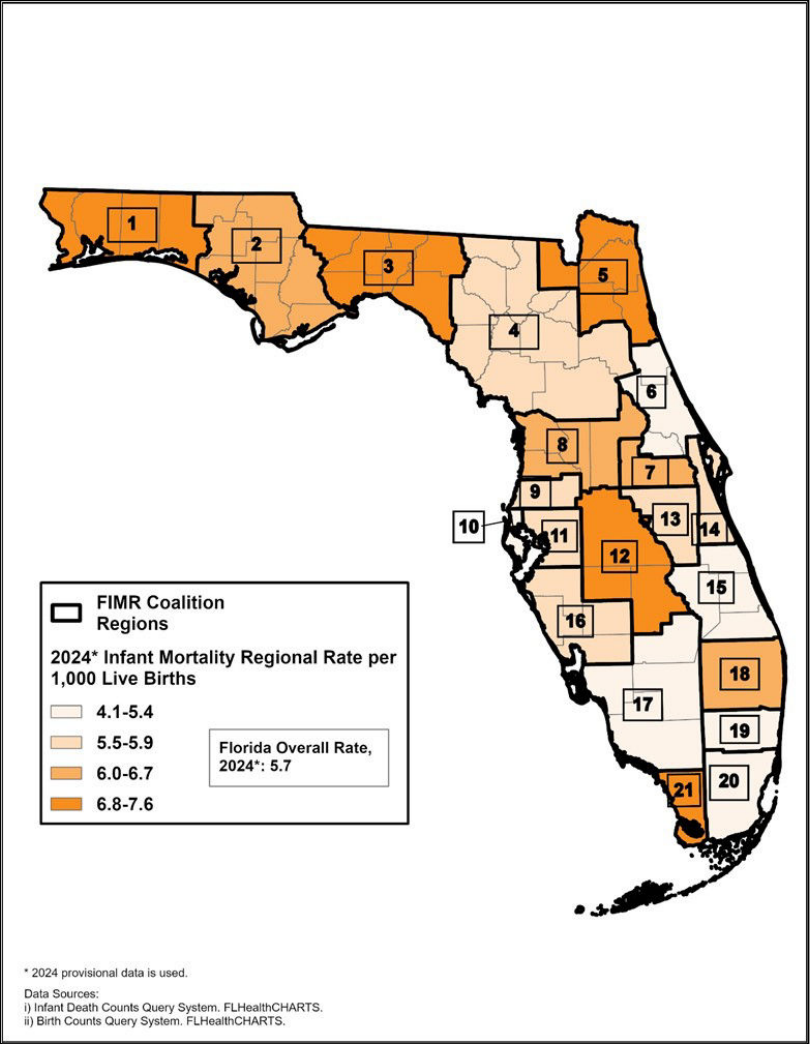

Infant mortality is the death of a live-born baby during the first year of life. The infant mortality rate is calculated by the number of infant deaths divided by the number of live births, multiplied by 1,000.

Figure 5. Top Five Leading Causes of Infant Death (n=1,276), Florida, 2024*

Cause of Death	Count	Percent
Congenital Malformations, Deformations, and Chromosomal Abnormalities	256	20.1%
Disorders Related to Short Gestation and Low Birth Weight	161	12.6%
Unintentional Injuries	114	8.9%
Maternal Complications of Pregnancy	80	6.3%
Complications of Placenta, Cord, and Membranes	55	4.3%

Data Source: FLHealthCHARTS *Includes 2024 provisional data.

Figure 6. Infant Mortality Rate by FIMR Regions, Florida, 2024*

Local Level Recommendations

Local CAGs submit annual action plans to the Department. These action plans contain goals, activities, and measurable outcomes. Below is a list of the five most common recommendations from the CAG action plans.

- Provide safe sleep education to families, community members, physicians, and hospitals. Education should be provided multiple times including during pregnancy, in the hospital, and through home visiting.
- Improve preconception health and increase awareness of the importance of healthy lifestyle behaviors.
- Educate local communities about resources available to support a healthy pregnancy, including home visiting programs. This should include the importance of early entry to prenatal care.
- Encourage pregnant women to monitor fetal movements during the third trimester of pregnancy.
- Decrease the number of women who smoke during pregnancy.

State Level Improvement Strategies

The Department implements programs and initiatives to improve fetal and infant health outcomes, including the following:

- A contract with the Florida Perinatal Quality Collaborative, housed at the University of South Florida College of Public Health, to improve infant and maternal health outcomes through training and support to Florida's birthing hospitals.
- Funds provided to each county health department for Florida's Healthy Babies Program to improve maternal and child health, including fetal and infant outcomes.
- Implementation of Florida's Healthy Start program.
- Oversight of Florida's Child Abuse Death Review.
- A contract with Healthy Birth Day, Inc., and their Count the Kicks campaign, an evidence-based stillbirth prevention campaign focused on educating expectant parents about the importance of tracking fetal movement during pregnancy by counting their baby's movements during the third trimester.
- Florida's State Health Improvement Plan that includes goals and strategies to reduce infant morbidity and mortality.
- Florida's Pregnancy Care Network, offering education and support resources to assist women with unexpected pregnancies.

- A contract with Nurse Family Partnership to offer home visiting services by a licensed nurse to provide education and guidance to a woman from pregnancy through her child's third birthday, impacting safe parenting and fetal and infant outcomes.
- Funds provided to Florida's A Safe Haven for Newborns program to assist with media, education, and community awareness information about the program, which provides women and girls the option to request assistance during pregnancy or provides a safe alternative to infant abandonment, saving the lives of Florida's infants.
- Implementation of Florida's Electronic Prenatal Screen to determine risk factors for pregnant women that results in referrals to services to support a healthy pregnancy and birth, limiting the chance of death for the fetus or infant.
- Implementation of the Telehealth Maternity Care program, which provides prenatal and postpartum services through telehealth services to reduce barriers to care and improving pregnancy and birth outcomes for women and infants.

FIMR Regional Profiles

The FIMR regional profiles on the following pages reflect fetal and infant mortality data for each region. For each profile, the rates were tested to determine if changes observed between 2020 and 2024 were statistically significant.

The data reported in the regional profiles are not statistically significant, unless otherwise noted where applicable. The data used in these tables were obtained from FLHealthCHARTS: birth counts, fetal death counts, and infant death counts. The 2024 provisional data was used for the profile tables.
